

Dish solar power generation and heating

Overview

They use a precision-engineered, dish-shaped reflector to focus direct solar radiation onto a single focal point, generating extremely high temperatures for power generation, process heating, or research studies.

[Dish/Engine System Concentrating Solar-Thermal Power Basics](#)

The solar concentrator, or dish, gathers the solar energy coming directly from the sun. The resulting beam of concentrated sunlight is reflected onto a thermal receiver that collects the solar heat.

Solar-powered Stirling engine

NASA patented a type of solar-powered Stirling engine on August 3, 1976. It used solar energy to pump water from a river, lake, or stream. The purpose of this apparatus is to "provide a low-cost, low-technology pump having particular utility in irrigation systems employed in underdeveloped arid regions of the earth the basic principles of the Stirling heat engine". Another design was patented by Roelf J. Meijer in 1987. His invention combines a heat engine, such a
