[What is the difference between list and list\[:\] in python?](#)

When reading, list is a reference to the original list, and list[:] shallow-copies the list. When assigning, list (re)binds the name and list[:] slice-assigns, replacing what was previously in the

list.

[Difference between List, List>, List, List, and List](#)

The notation List> means "a list of something (but I'm not saying what)". Since the code in test works for any kind of object in the list, this works as a formal method parameter. Using a type parameter

python

can we have list comprehension without a for loop and just if/else to put a single default value inside the list and later extend it if required? i.e. result = ['hello' if x == 1].

[What is the difference between list and list \[1:\] in Python?](#)

By using a : colon in the list index, you are asking for a slice, which is always another list. In Python you can assign values to both an individual item in a list, and to a slice of the list.
