List of photovoltaic bracket suppliers

Meaning of list[-1] in Python

I have a piece of code here that is supposed to return the least common element in a list of elements, ordered by commonality: `def getSingle(arr): from collections import Counter c = Counter`

[Difference between List, List>, List, List, and List](#)

The notation List> means "a list of something (but I'm not saying what)". Since the code in test works for any kind of object in the list, this works as a formal method parameter. Using a type parameter

[What is the difference between list and list \[:\] in python?](#)

When reading, list is a reference to the original list, and list[:] shallow-copies the list. When assigning, list (re)binds the name and list[:] slice-assigns, replacing what was previously in the list.

What does [:-1] mean/do in python?

Working on a python assignment and was curious as to what [:-1] means in the context of the following code: `instructions = f.readline()[:-1]` Have searched on here on S.O. and on Google but

[What is the difference between list and list \[1:\] in Python?](#)

python

can we have list comprehension without a for loop and just if/else to put a single default value inside the list and later extend it if required? i.e. `result = ['hello' if x == 1]`.

Python: list of lists

The first, [:], is creating a slice (normally often used for getting just part of a list), which

By using a : colon in the list index, you are asking for a slice, which is always another list. In Python you can assign values to both an individual item in a list, and to a slice of the list.
