

Substation connected to generator set

Overview

This article delves into the intricacies of low voltage automatic transfer schemes at substations. We will explore the design and implementation of these systems, providing detailed insights into various ATS components and their functions.

The main generator is connected to the switchyard via two circuit breakers in the switchyard. Either breaker enables the generator to provide power to the transmission system.

 Figure 2 shows a similar application with paralleling generators replacing the single generator set. In this situation the generator sets may be specifically selected to be of multiple sizes to allow for minimizing the fuel consumption at a site by closely matching the capacity of the operating equipment to the system loads.
