

Three generations of solar panels

Overview

Third-generation photovoltaic cells are that are potentially able to overcome the of 31-41% power efficiency for single solar cells. This includes a range of alternatives to cells made of semiconducting ("first generation") and ("second generation"). Common third-generation systems include multi-layer ("tandem") cells made of or , while more theoretical developments include frequency conversion, (i.e. cha.

Solar Cell Types

Based on active materials and power conversion efficiency (PCE), solar cells are classified into three different generations, namely, first, second, and third generation.

Third-generation photovoltaic cell

Third-generation photovoltaic cells are solar cells that are potentially able to overcome the Shockley-Queisser limit of 31-41% power efficiency for single bandgap solar cells. This includes a range of alternatives to cells made of semiconducting p-n junctions ("first generation") and thin-film cells ("second generation"). Common third-generation systems include multi-layer ("tandem") cells made of amorphous silicon or gallium arsenide, while more theoretical developments include frequency conversion, (i.e. cha
